# Statistical programming languages - House Prices: Advanced Regression Techniques

Christian Koopmann Felix Skarke Enno Tammena

Ladislaus von Bortkiewicz Chair of Statistics Humboldt–Universitaet zu Berlin http://lvb.wiwi.hu-berlin.de

#### Motivation

- □ demonstrate some of Rs machine learning capabilities
- develop and test different models to predict the price of houses in Ames, lowa
- dataset: Ames Housing data published in a kaggle competition with 79 explanatory variables

## **Outline**

Exploratory Data Analysis

Exploratory Data Analysis Dependence

**Data Preprocessing** 

Regression Models

Random Forest

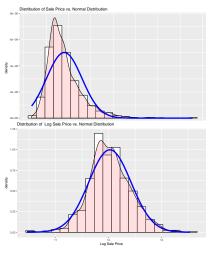

Model Comparison

# Data Structure / Quality

- 2919 Observations separated into 1460 labelled training observations and 1459 unlabelled test observations to predict.
- □ Target Variable: Final Sale Price in USD
- 79 Explanatory Variables of which 36 are numeric (e.g. floor area) and 43 categoric (e.g. heating type).
- NA usually means a variable is not applicable (Pool Quality if house has no pool) instead of missing data

## Sale Price Distribution

- Original price distribution heavily skewed
- Log transformed House Prices seem to be normally distributed

# Quantlet: Exploratory Data Analysis: Dependence

- im of this quantlet: show relations between variables, especially the target variable SalePrice
- producing different graphical representations
  - correlation matrix
  - barplot
  - boxplots

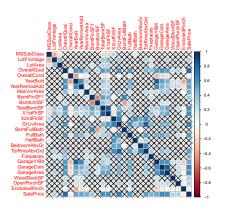

# Correlation Matrix of all numeric variables: Code

```
corr.func = function(data, cut.value, corr.mat = FALSE, corr.test =
     FALSE, significance = 0.05) {
  corr.numeric =cor(na.omit(numeric.data))
  find.rows = apply(corr.numeric, 1, function(x) sum(abs(x)> abs(cut.
     value))>1)
   corr.numeric.adjusted = corr.numeric[find.rows.find.rows]
5
6
7
       pdf("Corrplot.pdf")
       if (corr.test == FALSE) {
8
           corrplot (corr.numeric.adjusted, method = "square")
       } else {
10
           corrplot (corr. numeric. adjusted,
11
12
           p.mat = correlation.test(corr.numeric.adjusted),
13
           sig.level = significance, method = "square")
14
       dev. off()
15
16
       if (corr.mat == TRUE)
17
           return (corr. numeric. adjusted)
18
19
```

# Correlation Matrix of all numeric variables: Code ctd.

```
correlation.test = function(corr.data) {
21
22
       corr.data
                             = as.matrix(corr.data)
23
                             = ncol(corr.data)
24
       p. value . matrix
                            = matrix(NA, n, n)
25
       diag(p.value.matrix) = 0
26
27
       for (i in 1:(n-1)) {
        for (i in (i + 1):n) {
28
         tmp = cor.test(corr.data[, i], corr.data[, j])
29
         p.value.matrix[i, j] = p.value.matrix[j, i] = tmp$p.value
30
31
         colnames(p.value.matrix) = rownames(p.value.matrix) =
32
                         colnames (corr.numeric.adjusted))
33
   return (p. value . matrix)
34
35
```

# Plot of Correlations (Corrplot)

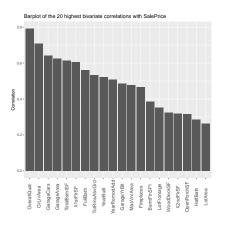

- A cut-off value of 0.3 was used: Variables with no correlation over 0.3 do not show up in the plot
- A significance level of 0.05 was used to test the correlations (crosses indicate no significance)

## Barplot: Code

```
corr.barplot = function(numb.corr = 36) {
36
37
           correlation . vars
                                = names(numeric.data) %in% c("SalePrice")
38
           correlation data
                                = numeric.data[!correlation.vars]
                                = vector(length = length(names(correlation
39
           correlations
              . data)))
           names(correlations) = names(correlation.data)
40
           for (i in names(correlation.data)) {
41
                correlations[i] = cor(numeric.data$SalePrice. correlation.
42
                  data[i], use = "pairwise.complete.obs")}
43
           y.plotting = correlations[order(abs(correlations),
44
              decreasing = TRUE) [[1:numb.corr]
45
           x.plotting = names(v.plotting)
46
           names (y. plotting) = NULL
47
           df = data.frame(x.plotting, y.plotting)
48
49
           df$x.plotting = factor(df$x.plotting, levels =
              df[order(abs(df$y.plotting), decreasing = TRUE), "x.plotting
50
51
           ggplot(data = df, aes(x.plotting, y.plotting), fill = as.factor
52
              (x.plotting)) + geom bar(stat = "identity") +
53
               theme(axis.title.x = element blank(), axis.text.x = element
                   text(angle = 90. viust = 0.5. size = 12)) +
                ylab ("Correlation") + ggtitle (paste ("Barplot of the", numb.
54
                  corr, "highest bivariate correlations with SalePrice"
55
56 House Prices: Advanced Regression Techniques
```

# Ordered barplot for the correlations with SalePrice

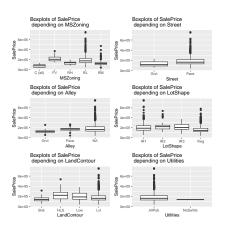

- The plot shows the 20 numeric variables that have the highest absolut correlation with SalePrice
- Out of 36 variables in the dataset only 10 have a correlation higher then 0.5

## Boxplot: Code

```
boxplot.target = function(categoric) {
58
           categoric.x = data[, categoric]
59
            plot.data = as.data.frame(cbind(data$SalePrice, categoric.x))
60
61
            plot.data[[2]] = as.factor(plot.data[[2]])
            levels(plot.data[[2]]) = levels(categoric.x)
62
63
            ggplot(plot.data, aes(x = categoric.x, y = V1)) + geom boxplot
64
              () +
              labs(title = paste("Boxplots of SalePrice",
65
                "\n", "depending on", categoric, sep = " "),
66
                 x = categoric \cdot v = "SalePrice")
67
68
```

## **Boxplots of SalePrice**

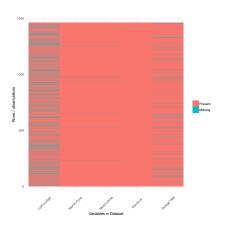

- Example of boxplots for SalePrice based on the levels of categorical variables
- Differences in median and spread across levels indicate a possibly good predictor variable

## Quantlet: Data Preprocessing

- ightharpoonup aim of this quantlet: ensure, that the data quality is sufficent for all types of models that will be used
- □ handling of missing data, including imputation
- reduction of dimensionality
  - merging of factor levels
  - principal component analysis
- detetection and handling of outliers

## **Missing Data**

- based on data description, most NA's have a meaning (None/Other)
- imputation of remaining NA's
  - numeric variables: median
  - factor variables: mode

## Missing Data: Code

```
Mode = function(x) {
    ux = unique(x)
    ux[which.max(tabulate(match(x, ux)))]

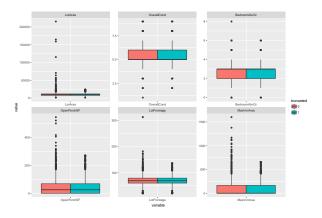

impute.mode = function(x){
    nas = is.na(x)
    x[nas] = Mode(x[!nas])
    as.factor(x)

categoric.imputed = as.data.frame(sapply(categoric.data, impute.mode))
```

## **Outlier Handling: Code**

```
outlier.count = function(x){
       low =as.numeric(quantile(x)[2] - IQR(x)*3)
2
       high=as.numeric(IQR(x)*3 + quantile(x)[4])
       sum(x >= high | x <= low)
  outlier.truncate = function(x){
        low =as.numeric(quantile(x)[2] - IQR(x)*3)
7
        high=as.numeric(IQR(x)*3 + quantile(x)[4])
        x[x < low] = low
        x[x > high] = high
10
        return(x)
11
12
  df_outlier_trunc = as.data.frame(sapply(df.temp.
    numeric, outlier.truncate))
```

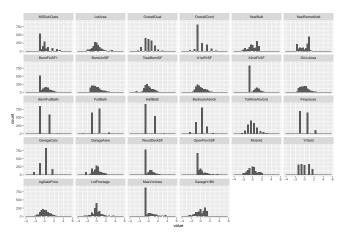

## Outlier: Before and after truncation

## **Dimensionality Reduction: Code**

```
single.factors = function(data) {
      for(var in names(data)) {
2
          if(is.factor(data[[var]])){
              tbl = table(data[[var]])
              ren = names(tbl)[tbl <= 20]
              levels(data[[var]])[levels(data[[var]])
                %in% ren] = "Other"
              tbl = table(data[[var]])
              tbl sum = sum(tbl < 20)
              if(nlevels(data[[var]]) < 3 & tbl_sum >=
                 1 ) data[[var]] = NA
10
11
      return (data)
12
13
```

# **Preprocessing: Summary**

## **Quantlet: Regression Models**

- □ aim of this quantlet: select appropriate variables
- four selection procedures
  - Backwards Selection based on significance
  - Forward Selection based on AIC
  - LASSO
  - Ridge

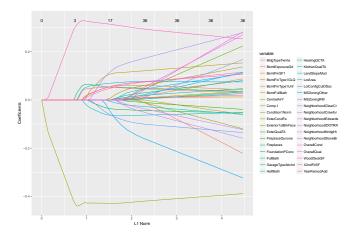

## Significance Selection: Code

```
sign.select = function(dframe, y) {
|z| pvals = 1, z = 1, i = 1
3 vars = names(dframe)
4 vars = vars[!vars %in% y]
  while (z>0) {
      df.lm = cbind(dframe[vars], dframe[v])
      lm1 = lm(formula(paste(y,"~ . ")) ,data=df.lm)
      pvals = summary(lm1)$coefficients[,4]
      pvals = pvals[!names(pvals) %in% "(Intercept)"]
      vars = names(pvals[pvals<0.05])</pre>
10
      \#z = sum(pvals > 0.05), \qquad i = i+1
11
      if(i==300){
12
           warning("... No signif. Vars in Data Set?")
13
          break
14
15
16 }

```

### LASSO: Code

```
lm.penal = function(type, x, y) {
     } else if ( type == "ridge") {alpha = 0
     } else stop("type must be ridge or lasso")
     cvfit = cv.glmnet(x, y, alpha = alpha,
      nfolds = 10)
     fit = predict(cvfit,newx=x,s="lambda.1se")
     rsq = 1 - sum((fit - y)^2)/sum(y^2)
     c = coef(cvfit, s = "lambda.1se")
     inds = which(c != 0)
     var = row.names(c)[inds]
10
     vars.sele = var[!variables %in% "(Intercept)"]
11
     coeftable = data.frame(var = var, coeff = c[inds
12
       ], stringsAsFactors = F)
     output = list(vars.sele, coeftable, c, cvfit,
13
        fit, rsq)

### Random Forest

- Applied Random Forest Regression Model to the data
- Collection of Regression Trees, where the predicted value is the average value in the leaf node.
- □ Results are averaged across all Regression Trees in the Forest
- Tuning Parameter: mtry Number of randomly selected variables per decision tree
- Model is tuned using the caret package and 5 Fold Cross Validation in a parallelized fashion using doParallel

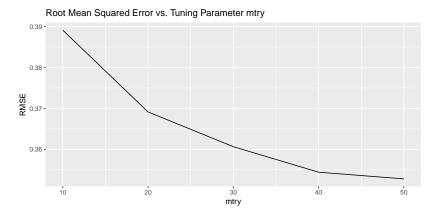

### Random Forest: Code

# Random Forest Tuning Results - RMSE

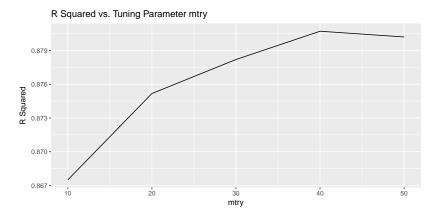

## Random Forest Tuning Results - RMSE

# Random Forest Tuning Results - R Squared

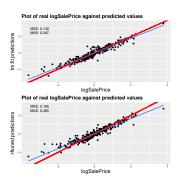

## Quantlet: Model Comparison

- aim of this quantlet: after building and training all the models on the training data the goal is to measure how they perform on new data (=test data)
- omputing different measures and show results graphically
  - Mean Squared Error
  - Bias
  - real Vs. predicted plots

## Real Vs. Predicted: Code

```
predictions.lm = predict(lm.fit, newdata = test)
70
   df.lm.fit
                  = data.frame(cbind(test$logSalePrice, predictions.lm ))
71
72
   lm.plot = ggplot(df.lm.fit, aes(test$logSalePrice, predictions.lm)) +
73
     geom point() + geom segment(x = -4, y = -4, xend = 4, yend = 4,
     color = "red", size = 1.3) +
74
       stat smooth (method = "Im", se = FALSE) +
75
       labs (title = "Plot of real logSalePrice against predicted values",
       x = "logSalePrice", v = "lm.fit predictions") + theme(axis.title =
76
          element text(size = 16), plot title = element text(size = 16,
       face = "bold")) +
77
       annotate("text", label = paste("MSE:", comparison.result["MSE", "Im
78
          "], sep = ""), x = -3, y = 3) +
       annotate ("text", label = paste ("MAE:", comparison result ["MAE", "Im
79
          "1, sep = " "), x = -3, y = 2.5)
```

### Real Vs. Predicted Plots

- If the house prices were predicted perfectly, all points would lie on the red line
- The blue line comes from an OLS regression: The better the predictions, the more blue and red lines should align

# Performance measure example: MSE Code

```
model.mse = function(model, test.data = test) {
      if (class(model)[1] %in% c("train", "lm")) {
2
          pred = predict(model, newdata = test.data)
          mse = (1/ncol(test.data)) * sum((pred -
            test.data$logSalePrice)^2)
      } else {
          pred = predict(model, newx = as.matrix(test.
            data[!names(test.data) %in% "logSalePrice"
            ]), s = "lambda.1se")
          mse = (1/ncol(test.data)) * sum((pred -
            test.data$logSalePrice)^2)
      return (mse)
10
```

# Result comparing all models

	lm	fwd	lasso	ridge	gbm	rf
MSE	0.14	0.12	0.19	0.19	0.14	0.16
${\sf MSEtrain}$	0.70	0.57	0.94	0.88	0.48	0.14
MAE	0.35	0.33	0.40	0.40	0.37	0.36
BIAS	0.02	0.03	0.03	0.03	0.04	0.03
RSQ	0.91	0.92	0.88	0.88	0.91	0.90

 In comparison the self built linear model and the forward algorithm have the best results amongst all implemented models

### **Conclusions**

- In the presented examples, the more complex models appear to overfit the training data
- Linear models work better which suggests that the relationship between log House Prices and the input variables are indeed linear
- Follow our repository at: https://github.com/ckoopmann/SPL-HousePriceRegression
